See also main SDK page.

#### **EFE** - Introduction

In this example we will show how to create custom enumeration factory. what will be shown in the example

1. how to create custom enumeration factory- we will implement factory for Time Point enumeration

### EFE - Java API Workspace preparation

See section Workspace preparation

#### EFE - Creating project plugin

The best way is to import provided example, which contains all dependencies you need for custom plugin creation

#### EFE - Import of the example

Info: You must ensure that your plugin is compiled against your Polarion version. This example contains precompiled jar plugin. You can remove it before you start developing your plugin based on this example. The Eclipse ensure that new jar plugin will be created against your source code and Polarion version.

To import this example to workspace, do these steps:

- 1. Select File > Import...
- 2. In the dialog that appears, select Existing Project into Workspace in General section and press Next button.
- 3. By pressing **Browse.**. button, select the directory of examples (mostly in C:\Polarion\polarion\SDK\examples\). Submit it.
- 4. Select com.polarion.example.enumeration factory and press Finish.

### **EFE - Deployment to Installed Polarion**

See section Deployment to Installed Polarion

# **EFE - Execution from Workspace**

See section Execution from Workspace

### **EFE** - Configuration

After successful deployment of plug-in into Polarion, you can modify custom fields configuration to start using new enumaration factory:

 Select the Repository or project view. Go to Administration perspective, choose Custom Fields in Work Items section and go to editor for specific work item type. Here in editor select Type "Enum:" and new option "My Time Points".

# Requirements

# **Development Environments**

- Eclipse IDE for Java EE Developers or any other Eclipse IDE with The Eclipse Plug-in Development Environment (Go to Help > Install New Software... > Install Eclipse Plug-in Development Environment > Restart Eclipse)
- Java Platform, Standard Edition 8 Development Kit or Java bundled with your Polarion installation

## Polarion Server

• Polarion Server with version 3.1.0 and higher

## **Workspace Preparation**

To start developing a Polarion Java API plug-in, you first need to perform following steps:

- 1. Start Eclipse, then select Window > Preferences...
- 2. In the dialog that appears, select Plug-In Development > Target Platform.

- 3. Click the Add button on the right.
- 4. Keep the Nothing: Start with an empty target definition option selected and click Next.

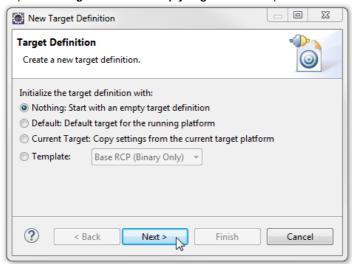

Figure WP-1: Starting with an Empty Target Definition

- 5. Enter a Name and click Add.
- Select

Directory and click Next.

7. Click Browse, select the C:\Polarion\polarion folder and click Next.

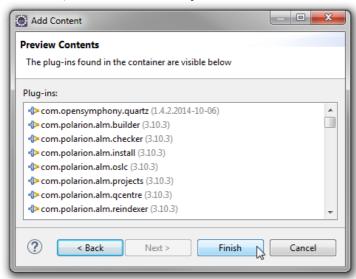

Figure WP-2: Currently Installed Polarion Plug-ins

8. A list of currently installed Polarion plug-ins appears. Click Finish.

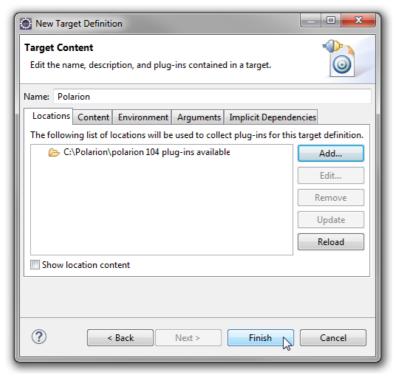

Figure WP-2: Confirm the Selected Path

9. The selected path and the number of discovered plug-ins available appear. Confirm that the path is correct and click Finish.

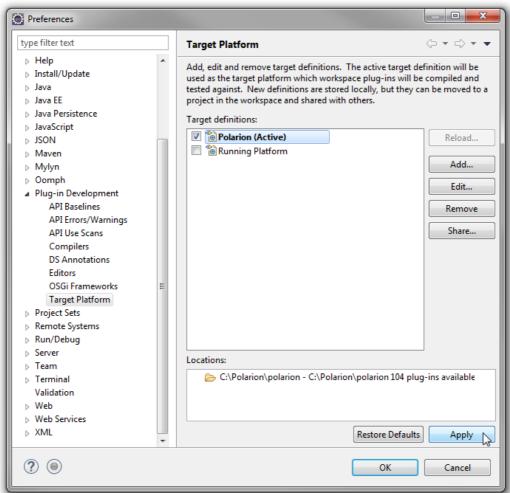

Figure WP-2: Select the Target Platform

10. Check the box beside the newly added path and click Apply.

# **Deployment to Installed Polarion**

You can deploy a plugin to Polarion in two ways. First you can export a project as Deployable Plugins and Fragments. The second

way is described in the following section Execution from Workspace. To export the plug-in, perform these steps:

- 1. Select File > Export...
- 2. In the dialog that appears, select **Deployable Plugins and Fragments** in **Plug-in Development** section and click the **Next** button.
- 3. Mark your project (e.g. for Servlet example it will be com.polarion.example.servlet), and as the destination directory specify the polarion folder of your Polarion installation directory (usually in C:\Polarion\polarion)
- 4. At the Options card be sure, that Package plug-ins as individual JAR archives is unchecked. Click Finish.
- 5. Because this is a new polarion plug-in extension, you have to restart your Polarion server.

## **Execution from Workspace**

The second way to deploy the plug-in to Polarion is to launch Polarion directly from your Eclipse workspace. This method has the added advantage of debugging the code directly in Eclipse.

- 1. Select Run > Open Debug Configurations..
- 2. Create a new Eclipse application (double click on Eclipse Application)
- 3. You should set:

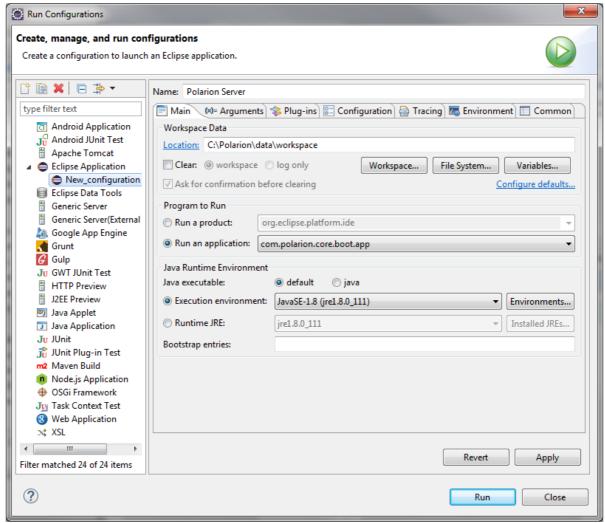

Figure WP-2: Debug - Main page

- Name to Polarion Server
- Workspace Data Location to C:\Polarion\data\workspace (assuming that your Polarion is installed in C:\Polarion\)
- $\bullet$  Run an application to  ${\tt com.polarion.core.boot.app}$  in the Program to Run section
- Finally set your Runtime JRE
- 4. On the second, "Program Arguments" tab, set the following arguments:
  - to Program Arguments section:

```
-os win32 -ws win32 -arch x86 -appId polarion.server

1.

• to VM Arguments section:

-Xms256m -Xmx640m -XX:MaxPermSize=128m -XX:PermSize=128m
```

Of course, you have to change parameters to Polarion server according your installation.

Note that, when using Java 8 the arguments XX: MaxPermSize and XX: PermSize are obsolete and must not be used anymore.

You can check the settings with the following screenshot:

-Xbootclasspath/a:C:\Polarion\bundled\java\lib\tools.jar

-Dcom.polarion.home=C:\Polarion\polarion

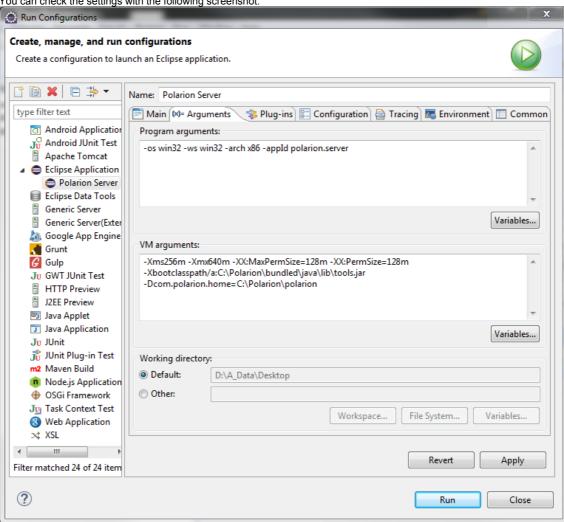

Figure WP-3: Debug - Arguments page

- 2. On the third "Plugins" tab, make sure, you have also selected "Target Platform" plugins.
- 3. Select all, and then click the Validate Plug-ins button. If there are some problems, uncheck the plugins which are in conflict.

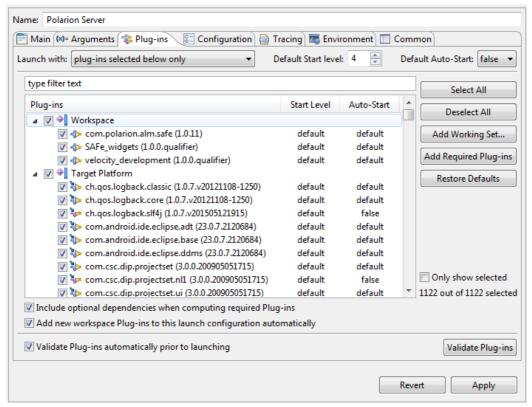

Figure WP-4: Debug - Plug-ins page

4. Other pages shouldn't be changed. Just click the **Debug** button, and go on with your new Polarion Server application.
